Posters: multi-agent plans and planning: Multiagent planning through plan repair

Roman van der Krogt, Nico Roos, Mathijs de Weerdt, Cees Witteveen

agents and multiagent systems AAMAS '05

July 2005 Proceedings of the fourth international joint conference on Autonomous

Publisher: ACM Press

Full text available: pdf(299.46 KB) Additional Information: full citation, abstract, references, index terms

We present a novel approach to multiagent planning for self-interested agents. The main idea behind our approach is that multiagent planning systems should be built upon (single-agent) plan repair systems. In our system agents can exchange goals and subgoals through an auction, using their own (planning) heuristics and utility functions to determine when to auction and what to bid. Some experimental results for a logistics domain show that this system can be used to support the coordinati ...

2 Buffer planning: Buffer allocation algorithm with consideration of routing congestion Yuchun Ma, Xianlong Hong, Sheqin Dong, Song Chen, Yici Cai, Chung-Kuan Cheng, Jun Gu January 2004 Proceedings of the 2004 conference on Asia South Pacific design automation: electronic design and solution fair ASP-DAC '04, Proceedings of the 2004 conference on Asia South Pacific design automation: electronic design and solution fair ASP-DAC '04

Publisher: IEEE Press, IEEE Press

Full text available: pdf(86.19 KB) Publisher Site

Additional Information: full citation, abstract, references

The dominating contribution of interconnect to system performance has made it critical to plan the buffers and the routes resource in the early stage of the layout. In this paper, we present a congestion estimation model which takes the buffer insertion sites into consideration. Based on the feasible region of the buffer insertion, the two-level tile structure is used to represent the distribution of the feasible buffer insertion sites among the routing tiles. And the buffer allocation method is ...

### **ABSTRACT**

In construction, rework (redoing previously completed work) has a considerable impact on pro-ject performance. As a result, construction managers often avoid rework on problematic tasks by modifying the design and specification of downstream tasks ("change"). Such a managerial action, however, can disturb the construction sequence by triggering non-valueadding change iterations among construction processes, which often contributes to unanticipated schedule delays and cost overruns. In order to address this challenging issue, different characteristics and behavior patterns of construction changes are identified, and compared to those of construction rework. Change impact on project performance is analyzed according to change characteristics, and to discovery status and time. All research findings are then incorporated into a cohesive dynamic project model. An application example of the project model demonstrates how model-based change management can enhance project performance in a real-world setting by providing effective management plans and policy guidelines. Finally, it is concluded that the model-based approach can be more effective, when combined with other managerial efforts such as reducing the process time and increasing the level of coordination among project functions.
